

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY  
REGION III  
1650 Arch Street  
Philadelphia, Pennsylvania 19103-2029

Ms. Jutta Schneider, Director  
Water Planning Division  
Virginia Department of Environmental Quality  
1111 East Main Street, Suite 1400  
Richmond, Virginia 23219

OCT 18 2019

Dear Ms. Schneider:

The U.S. Environmental Protection Agency (EPA) has completed its review of the new or revised provisions of the Virginia Water Quality Standards (WQS) regulations at 9 VAC 25-260. Sections 140 and 170 include revisions to bacteria criteria for human health protection in recreation waters, revisions to cadmium criteria for the protection of aquatic life, and updates for 94 human health criteria. Virginia adopted the WQS revisions on June 24, 2019 and the Virginia Office of Attorney General certified the revisions as duly adopted in accordance with Virginia law in a letter dated July 31, 2019. The EPA received this package on September 4, 2019.

The EPA's review of each revision is discussed in the enclosed decision document. Based on EPA's review of the submission and supporting documentation, EPA finds that the new or revised WQS provisions adopted by Virginia are consistent with CWA Section 303(c) and its implementing regulations at 40 CFR Part 131. The decision document also lists a number of new or revised provisions that EPA is not approving as part of this action, because EPA does not consider those provisions to be new or revised WQS subject to review under CWA Section 303(c).

Under Section 7 of the Endangered Species Act (ESA), 42 U.S.C. §1536, EPA has the obligation to ensure that the Agency's approval of these modifications to the State's aquatic life WQS regulations will not jeopardize the continued existence of Federally-listed threatened and endangered species and their critical habitat in Virginia. To fulfill our obligation, EPA prepared a biological evaluation of the revised cadmium criteria for the protection of aquatic life provision of Virginia's regulation and concluded that our approval is not likely to adversely affect listed species and their critical habitat. The U.S. Fish and Wildlife Service concurred with this conclusion on October 19, 2018, and the National Marine Fisheries Service on October 23, 2018.

Printed on 100% recycled/recyclable paper with 100% post-consumer fiber and process chlorine free.  
Customer Service Hotline: 1-800-438-2474

If you have any questions regarding this action, please do not hesitate to contact me or have your staff contact Cheryl Atkinson, at 215-814-3392.

Sincerely,

Catherine A. Libertz, Director  
Water Division

## Decision Document

Revisions to Virginia's Water Quality Standards

**Table 1A Bacteria Criteria: 9VAC25-260-170. Bacteria; Other Recreational Waters.**

| Revisions are strikethrough for deletion and underline for additions.   | EPA Action Rationale   |
|---|--|
| <p>9VAC25-260-170. Bacteria; other recreational waters.</p> <p>A. The following bacteria criteria (colony-forming units (CFU) counts/100 ml) shall apply to protect primary contact recreational uses in surface waters, except waters identified in subsection B of this section:</p> <p><u>In freshwater, E. coli bacteria shall not exceed a monthly geometric mean of 126 CFU counts/100 ml in freshwater and shall not have greater than a ten percent excursion frequency of a Statistical Threshold Value (STV) of 410 counts/100 ml, both in an assessment period of up to 90-days.</u></p> <p><u>In transition and saltwater, Enterococci bacteria shall not exceed a monthly geometric mean of 35-CFU counts/100 ml in transition and saltwater and shall not have greater than a ten percent excursion frequency of a Statistical Threshold Value (STV) of 130 counts/100 ml, both in an assessment period of up to 90-days.</u></p> | <p>EPA finds Virginia's updates to its geometric mean (GM) and a statistical threshold value (STV) to its bacteria criteria consistent with EPA's 2012 National Recommended Water Quality Criteria. EPA is approving pursuant to Section 303(c) of the Clean Water Act. In 2012, EPA published recommended water quality bacteria criteria for protection of recreational use (swimming). These updated criteria rely on the latest research and science. EPA considers a duration of up to 90 days to represent an acceptable critical exposure period to protect recreational uses for the following reasons. The epidemiological studies used to develop the 2012 criteria recommendations were conducted over exposure periods of up to 90 days, thus durations up to 90 days are scientifically defensible. For more information and supporting documents visit EPA's website at <a href="https://www.epa.gov/wqc/microbial-pathogen-recreational-water-quality-criteria">https://www.epa.gov/wqc/microbial-pathogen-recreational-water-quality-criteria</a>.</p> |
| <p><u>A2. Geometric means shall be calculated using all data collected during any calendar month with a minimum of four weekly samples.</u></p>   | <p>In applying protective bacteria criteria, the States have discretion in deciding how to apply the averaging period for the geometric mean. See 69 Fed. Reg. 67218, 67224 (Nov. 16, 2004). It is within the State's discretion to delete.</p>  |
| <p><u>A3. If there are insufficient data to calculate monthly geometric means in freshwater, no more than 10% of the total samples in the assessment period shall exceed 235 E. coli CFU/100 ml.</u></p>  | <p>Data sufficiency determinations are not water quality standards and therefore EPA takes no action on this provision.</p>  |

|  |  |
|--|--|
| A4. If there are insufficient data to calculate monthly geometric means in transition and saltwater, no more than 10% of the total samples in the assessment period shall exceed enterococci 104 CFU/100 ml.   | Data sufficiency determinations are not water quality standards and therefore EPA takes no action on this provision.   |
| A5. For beach advisories or closures, a single sample maximum of 235 E. coli CFU/100 ml in freshwater and a single sample maximum of 104 enterococci CFU/100 ml in saltwater and transition zones shall apply  | The 1986 bacteria criteria document included four single sample maximum (SSM) values appropriate for different levels of beach usage (use intensities). In the 2012 National Recommended Water Quality Criteria, EPA removed those recommendations and instead provided states with optional, precautionary BAVs for use in monitoring and notification programs. It is within the State's discretion to delete. |
| A2. In VPDES discharges to freshwater, bacteria in effluent requiring disinfection shall not exceed a monthly geometric mean of E. coli bacteria of 126 counts/100ml. Alternative performance standards may be established where an approved Long-Term Control Plan establishes an alternative level of disinfection for a combined sewer system. In VPDES discharges to transition and saltwater, bacteria in effluent requiring disinfection shall not exceed a monthly geometric mean of enterococci bacteria of 35 counts/100ml. | EPA understands that this addition is the VADEQ's effort to address frequency of bacterial effluent monitoring at permitted discharges requiring disinfection and is a permitting policy element. EPA is not acting on this revision as it is a permitting provision and not a water quality standard under CWA 303(c).  |

**Table 1B Cadmium Criteria: 9VAC25-260-140. Criteria for Surface Water.**

**EPA Action Rationale:** In 2016, the EPA published revised recommended criteria for cadmium for the protection of aquatic life. For information see EPA's aquatic life criteria website at: <http://www.epa.gov/wqc/aquatic-life-criteria-cadmium>. Virginia's amendment to its cadmium criteria for the protection of fresh and saltwater aquatic life is consistent with the 2016 EPA national recommended water quality criteria for cadmium. EPA is approving Virginia's amendment to its cadmium criteria pursuant to Section 303(c) of the Clean Water Act.

<sup>1</sup>One hour average concentration not to be exceeded more than once every 3 years on the average, unless otherwise noted.

<sup>2</sup>Four-day average concentration not to be exceeded more than once every 3 years on the average, unless otherwise noted.

**Table 1C Human Health Criteria: 9VAC25-260-140. Criteria for Surface Water.**

In 2015, EPA published updated ambient water quality criteria for the protection of human health for 94 chemical pollutants. These updated recommendations reflect the latest scientific information and EPA policies, including updated body weight, drinking water consumption rate, fish consumption rate, bioaccumulation factors, health toxicity values, and relative source contributions. For more information and supporting documents visit EPA's website at: <http://water.epa.gov/scitech/swguidance/standards/criteria/health/>. Virginia adopted amended criteria for the 94 updated human health parameters at the levels recommended by EPA. EPA finds Virginia's updates to its human health criteria consistent with EPA's National Recommended Water Quality Criteria. EPA is approving Virginia's amended criteria for the 94 updated human health parameters pursuant to Section 303(c) of the Clean Water Act.
